

Abstract of the Disclosure

Disclosed is a refrigerator door having a dispenser. The includes an outer case forming a front appearance of the refrigerator door, an inner case forming a rear appearance of the refrigerator, and an insulation layer formed between the
5 outer case and the inner case. First and second mounting frames are installed at both side ends of the refrigerator door and have first and second mounting slots longitudinally formed in the first and second mounting frames in opposition to each
10 other. The dispenser is detachably coupled to a front surface of the outer case and includes a housing, which forms an external appearance of the dispenser and is formed with a recess section. An external plate section is coupled to the front surface of the outer case except for an area in which the
15 dispenser is installed, in order to form an external appearance of the refrigerator door. Both side end portions of the external plate are inserted into the first and second mounting slots of the first and second mounting frames. A user variously selects a color of the refrigerator as required by the user. If
20 it is necessary to exchange the external plates or the dispenser, the user simply exchanges only the external plates or the dispenser without exchanging the refrigerator door.
